

UNICEF HQ VISION RAM v3 P1488

To address the vision and future of UNICEF, Avalon along with Community Systems Foundation has upgraded the Results Assessment Module of inSight - UNICEF's internal results planning and reporting platform.

The Results Assessment Module (RAM) is a primary source of organizational performance data. All Country Offices use RAM to document programme performance. Regional Offices and HQ Divisions also use RAM for annual reporting.

Launched in 2012, the platform has been updated several times to include enhancements requested by UNICEF aimed at making data access easier and to use data for simpler reporting on UNICEF's results at all levels.

RAM 3.0 is now being implemented to support an enhanced user interface, capability for data integration for simplified and more comprehensive results reporting and easier access to knowledge resources.

Updates include: 1) automating many external reporting requirements and enabling data integration with internal and external data systems, 2) digitizing work planning processes to facilitate harmonization/standardization of process across the organization, and 3) facilitating data integration and aggregation through a comprehensive Indicator Catalog and centralized management of all types of indicators.

Features

- Results-based monitoring and evaluation for UNICEF HQ
- Enhanced access and use of data through RAM
- System linkage with other data reporting systems

Benefits

- Solution provides a sustainable way for internally progress tracking and coordination
- Capacity-building and needs assessment mission in New York to understand system update requirements

Facts

Stakeholder	UNICEF HQ
Area	United States
